The topic which is given to us is :

To make a website on online tuck shop

Basically we are required to make a website for a online tuck shop .in this website we are going to make 5 pages.

The following 5 web pages are :

1. Our first page is going to contain home page
2. Second page is going to contain different shops in it.
3. Third page is going to contain items available.
4. Fourth page is going to contain timings and contacts for every shop
5. Fifth page is going to contain feedback of each step.

These are the pages that are website going to have. All the pages are going to be assign in this manner only.

Overview of our 5 pages:

Our first page which is home will have the name of the website and will have a background image to make it attractive.

Our second page which is different shops will have name of the differnt tuckshops whose items are going to be sell in this website or in other words shops which are available in the website.

Our third page which is items available will contain the list of items which are available in all tuck shops basically it will provide an idea to the people that what things are available in the tuck shop for selling online.

Our fourth page which is timings and contacts will contain timings of each tuckshop so that if someone want to contact the shop owner or have any query about the product or want to place order can directly contact them with the help of this .timings of each will also be written over their to avoid any confusion.

Our fifth page which is feedback of each shop will contain the feedback of the customer so that if they have any complain or any improvement is needed they can tell us which will make it easier for both customer and owner to solve their problems.

Languages we are going to use for making this website are:

\* HTML

\* CSS

**HTML-** full form is hypertext markup language is the standard language for documents designed to be displayed in web browser. It can be assisted by technologies such as cascading style sheets and scripting languages such as java script.

**CSS-** cascading style sheet is a style sheet language used for describing the presentation of a document written in a markup language like html.

Css is designed to enable the seperation of presentation and content including layout,colors,and fonts.

Now using these two languages we are going to make our website on online tuck shop.

App in which we are going to make our website is :

## **Net beans .**

Work divided among us :

To make this is project we have divided the work among us we have done the following distribution:

Firstly we have done distribution for making website

Shristi will make the first page which is home page and will add a background image to it .she will also make the second page which is about the names of different shop.

Janhavi will make the third page which is items available in it and also add the background image to it .she will also make fourth page which is timings and contact of each shop.

Tanvi will make the fifth page which is feedback and makes the background for all those pages which dont have background .she will also combine all are coding into one program so that the website is ready.

Now for the writing work:

Shristi will write half synopsis and 3 topics in final report.

Janhavi will write the other half of the synopsis and 3 topics in the final report.

Tanvi will make the final reports for the remaining 4 topics and the 1st page and index
